

## Starter Installation

---

When re-installing a starter on an 8N, the clearance problem can be averted by installing the armature with drive assembly into the engine case prior to installing the starter housing and brush assembly. After the armature and drive assembly is in the engine case, slip the starter case with end brush plate over the armature (don't forget the fiber washer on the armature) and then let the brushes down onto the commutator. Put in the bolts and proceed with tightening up the starter to the engine.
